

Software Engineering

Modern Approaches

Eric Braude and Michael Bernstein

Chapter 1. Introduction

- Why is software engineering important?
- Who and what does it consist of?
- What are its main activities?
- What are the principles of software engineering?
- What ethics are involved?
- What sorts of case studies will be used to illustrate the subject?

Goal of Software Engineering

- Creation of software systems that are
 - Reliable
 - Efficient
 - Maintainable
 - Meet the needs of customers
- Production of system meets
 - Schedule
 - Budget

What is Software Engineering?

- Engineering discipline
 - *the design, analysis and construction of an artifact for some **practical** purpose*
- IEEE definition:
 - *“the application of a systematic, disciplined, quantifiable approach to the development, operation and maintenance of software; that is the application of engineering to software.”*

NATO Study Group

- NATO Study Group on Computer Science (1968)
 - one of the first uses of the phrase *software engineering*
- “Programming management will continue to deserve its current poor reputation for cost and schedule effectiveness until such time as a more complete understanding of the program design process is achieved.”

NATO Study Group (cont.)

- “Today we tend to go on for years, with tremendous investments to find that the system, which was not well understood to start with, does not work as anticipated. We build systems like the Wright brothers built airplanes — build the whole thing, push it off the cliff, let it crash, and start over again.”

7

Software Disasters

- Numerous examples of software disasters
 - Ariane Project
 - 1990 AT&T Disaster
 - Radiation Overdose
- The link below has a list with several disasters due to software faults

https://en.wikipedia.org/wiki/List_of_software_bugs

8

Software Failure

- What is it?
 - Failure to meet expectations
- What expectations are not achieved?
 - Over budget
 - Exceeds schedule and/or misses market window
 - Doesn't meet stated customer requirements
 - Lower quality than expected
 - Performance doesn't meet expectations
 - Too difficult to use

© 2010 John Wiley & Sons Ltd.

9

Software Failure (cont.)

- Reasons for failure:
 - Unrealistic or unarticulated project goals
 - Poor project management
 - Inaccurate estimates of needed resources
 - Badly defined system requirements
 - Poor reporting of the project's status
 - Unmanaged risks
 - Poor communication among customers, developers, and users
 - Inability to handle the project's complexity
 - Poor software design methodology
 - Wrong or inefficient set of development tools
 - Inadequate test coverage
 - Inappropriate (or lack of) software process

10

Software Engineering Activities

4 P's of Software Engineering

- **People**
 - Project stakeholders
- **Product**
 - The software product plus associated documents
- **Project**
 - The activities carried out to produce the product
- **Process**
 - Framework within which the team carries out the activities necessary to build the product

© 2010 John Wiley & Sons Ltd.

11

People

Stakeholders

- **Business Management**
- **Project Management**
- **Development Team**
- **Customers**
- **End-Users**

© 2010 John Wiley & Sons Ltd.

12

The Software Product Artifacts

- Project documentation
 - Documents produced during software definition and development
- Code
 - Source and object
- Test documents
 - Plans, cases, and results
- Customer documents
 - Documents explaining how to use and operate product
- Productivity measurements
 - Analyze project productivity

© 2010 John Wiley & Sons Ltd.

13

Project

Software Project Activities

→ which produce a software product: Mainly...

- **Planning**
 - plan, monitor and control the software project
- **Requirements analysis**
 - define what to build
- **Design**
 - how to build the software
- **Implementation**
 - program the software
- **Testing**
 - validate software meets the requirements
- **Maintenance**
 - resolve problems; adapt software to meet new requirements;

14

Project (cont.)

- Development paradigm
 - e.g. object-oriented

© 2010 John Wiley & Sons Ltd.

15

Process

- Framework for carrying out the activities of a project in an *organized* and *disciplined* manner.
- Imposes structure
- Waterfall or Iterative

© 2010 John Wiley & Sons Ltd.

16

Waterfall Process

The Waterfall Software Process

- Simplest process
- Sequential
- Basis for others

© 2010 John Wiley & Sons Ltd.

17

Iterative Process

- Software projects rarely follow *strict* waterfall
- Some *iteration* between specifications, design, implementation and test
- Requires discipline
 - e.g. update specifications when design changes

18

Software Engineering Principles

Software Engineering Principles

1. *Make Quality Number 1*
2. *High Quality Software is Possible*
3. *Give Products to Customers Early*
4. *Use an Appropriate Software Process*
5. *Minimize Intellectual Distance*
6. *Inspect Code*
7. *People are the Key to Success*

19

Software Engineering Ethics

- Most disciplines operate under a strict set of *ethical* standards
- The *Merriam-Webster* online dictionary defines *ethics* as:
 - 1: the discipline dealing with what is good and bad and with moral duty and obligation
 - 2: a set of moral principles

© 2010 John Wiley & Sons Ltd.

20

Software Engineering Ethics (cont.)

- ACM/IEEE-CS Joint Task Force - *Software Engineering Code of Ethics and Professional Practices* (Version 5.1):
 - “Software engineers shall commit themselves to making the analysis, specification, design, development, testing and maintenance of software a beneficial and respected profession. In accordance with their commitment to the health, safety and welfare of the public, software engineers shall adhere to the following Eight Principles:

21

Software Engineering Ethics (cont.)

PREAMBLE

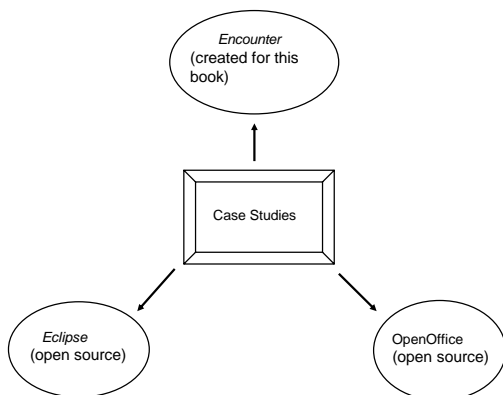

The short version of the code summarizes aspirations at a high level of abstraction; the clauses that are included in the full version give examples and details of how these aspirations change the way we act as software engineering professionals. Without the aspirations, the details can become legalistic and tedious; without the details, the aspirations can become high sounding but empty; together, the aspirations and the details form a cohesive code.

Software engineers shall commit themselves to making the analysis, specification, design, development, testing and maintenance of software a beneficial and respected profession. In accordance with their commitment to the health, safety and welfare of the public, software engineers shall adhere to the following Eight Principles:

1. PUBLIC - Software engineers shall act consistently with the public interest.
2. CLIENT AND EMPLOYER - Software engineers shall act in a manner that is in the best interests of their client and employer consistent with the public interest.
3. PRODUCT - Software engineers shall ensure that their products and related modifications meet the highest professional standards possible.
4. JUDGMENT - Software engineers shall maintain integrity and independence in their professional judgment.
5. MANAGEMENT - Software engineering managers and leaders shall subscribe to and promote an ethical approach to the management of software development and maintenance.
6. PROFESSION - Software engineers shall advance the integrity and reputation of the profession consistent with the public interest.
7. COLLEAGUES - Software engineers shall be fair to and supportive of their colleagues.
8. SELF - Software engineers shall participate in lifelong learning regarding the practice of their profession and shall promote an ethical approach to the practice of the profession.

By any use of this Website, you agree to be bound by these [Policies](#) and [Terms of Use](#).

Thank you!
Survey processed successfully. Your help is appreciated.

Where to go from here
We invite you to further visit the [OpenOffice.org](#) website to get acquainted with our community, our projects and our way of being. You should consider visiting [the Introduction](#) to OpenOffice.org, the [About Us](#) page, the [Documentation](#), the [OpenOffice.org](#) [a Mozilla](#) page, and the [Projects](#) page.

Then you might consider participating
Our community is open for anyone to participate. No matter if you are not a programmer or a technical oriented person, there is a place for you in one or more of our projects to help the development, improvement or promotion of the OpenOffice.org free office suite.

The first step into the participation is by subscribing to one or more of our mailing lists inside the project(s) you feel you can have a contribution to.

Below are some of our mailing lists that might be of interest. For a full listing please visit the [Mailing Lists](#) page on [OpenOffice.org](#) website.

| Project | Lead/Co-Lead | Short Name | Description |
|---|----------------------------------|----------------|---|
| API | Michael Hoenig, Juergen Schmidt | api | The application programming interface. |
| Application Framework | Matthias Bauer, Carsten Driesner | framework | The framework for applications. |
| Build Tools and Environment | Martin Hollmichel | tools | The tools used in build process and the build environment. |
| Database Access | Frank Schoorheit, Dirk Grobler | dba | The database access for the applications. |
| Documentation | Scott Carr | documentation | End-user documentation for the various components making up OpenOffice.org. |
| External | Martin Hollmichel (actor) | external | This project will host all the external code allowed. |
| Graphic Applications | Kai Ahrens, Christian Lopic | graphics | The graphic applications such as Draw and Impress. |
| Graphic System Layer | Christof Bratske, Henner Rohling | gsl | The Visual Class Library and other modules. |
| Installation | Dirk Voelcke | installation | Creating the installation set. |
| Lingucomponent | Kevin Hendricks | lingucomponent | Creating dictionaries, thesauri, and other related tools. |
